Title: Radon Surveys in the Workplace

Course Synopsis: In 2016, Health Canada published a guide to radon measurements in public buildings, including workplaces and public institutions. This course will present an overview of the new guidelines, including not only what practices are specified, but just as importantly, which are not.

Additionally, this course will include practical tips from the field, as well as touch on best practices with respect to quality assurance, project planning, record keeping and reporting, and safety.

This course is for measurement professionals who would like to have a practical understanding of how workplace and institutional radon surveys differ from small scale single family residential surveys.
